THE WEATHER DOESN'T COUNT

POTASH STARVES
PLENTY OF POTASH

Cotton Rusts

BECAUSE IT IS HUNGRY FOR POTASH

COTTON rust is not influenced by weather conditions as much as was generally believed, Southern experiment stations and growers are finding. Even with excessive rainfall, in many sections this year rust damage has been as severe as it was during the dry weather last year. There is only one known way to control cotton rust—USE MORE POTASH. In addition to controlling rust, potash produces larger yields, heavier seed and heavier bolls. It makes more lint per seed, better grade, longer staple, stronger fibers, and a higher percentage of normal fibers. RUSTED COTTON IS HARD TO PICK, and its poor quality causes Southern farmers an annual loss amounting to millions of dollars. Plan now to produce a crop next year that will grow normally to maturity. It can be done by using a fertilizer containing 6 to 10 per cent potash and a nitrogen-potash top-dresser if necessary. Consult your county agent or experiment station about the fertility of your soil. See your fertilizer dealer about the right amounts of potash in your cotton fertilizer. Write us for further information and literature.
